

SAMPLER PARAMETERS	
SLICE	Equal slices from C-1 <i>01 FILE uses markers saved in the wav</i>
PLAY	FWD, REV, FWDLOOP, REVLOOP <i>FWD PP and REV PP ping-pong back and forth</i>
OSC	Oscillator modes <i>Ignore START and don't restart on retrigger</i>
REPITCH	REPITCH/BPM <i>Pitch follows tempo; set STEPS/BPM below</i>
START	Start point <i>STA command; ignored in OSC modes</i>
LOOP ST.	Loop start <i>Where looping modes jump back to (LOP)</i>
LEN	Length <i>How much of the sample plays</i>
DETUNE	Detune <i>80 = center; 1st digit semitones, 2nd 1/16 semitone</i>
DEGRADE	Sample-rate crunch <i>Above 00 also turns off interpolation</i>
SLI	Slice command <i>Cue a slice marker from a phrase or table</i>

GOOD TO KNOW	
Slices Use the Note Column	PIT
- With SLICE on, the note picks the slice, not the pitch - PIT per step repitches one slice; DETUNE shifts them all	
Each Track Is a Choke Group	ONE TRACK
- A new hit cuts off the last one on the same track - Put open and closed hats on one track so the open hat chokes	
Keep the CPU Happy	MONO · 16-BIT
- Mono for kicks and bass; 16- or 8-bit instead of 24/32-bit - Avoid pitching a sample an octave or more above its original	
Lo-Fi Texture	DEGRADE
- DEGRADE here, or DOWNSAMPLE / 8-BIT in the editor - A RANDOM LFO on DEGRADE crunches each hit differently	
Linear Drumming	ONE TRACK
- Kick, snare, and hats on one track, so no hits overlap - Change the instrument per step; each hit gets its own space	

SAMPLE EDITOR PROCESSES	
CROP	Keep the selection <i>DELETE removes it, DUPLICATE repeats it</i>
NORMALIZE	Maximize level <i>Without clipping</i>
REVERSE	Flip in time <i>INVERT flips polarity instead</i>
FADE	FADE IN/OUT <i>Smooth the edges of a cut</i>
XFADE LOOP	Seamless loop <i>Crossfades inside the selection</i>
SQUISH	SQUISH(OTT) <i>Multiband squash using the mixer's OTT settings</i>
MONO	MIX / LEFT / RIGHT <i>Stereo to mono</i>
DOWNSAMPLE	Halve the sample rate <i>16-BIT and 8-BIT reduce bit depth</i>
SLICE:AUTO	Markers at transients <i>SLICE:SILENC uses silence instead</i>
SLICE:16	Even divisions <i>Any count from 0 to 128</i>

EDITING & RECORDING	
Crop a Loop to the Beat	OPT + UP/DOWN
- In SELECT, OPT + UP/DOWN snaps markers to the song's beats - Select exactly 1, 2 or 4 bars, then PROCESS → CROP	
Lazy Chop	PLAY + EDIT
- Highlight SLICE MARKER and play the sample - Tap PLAY + EDIT on each hit to drop a marker there - SAVE, then set the instrument's SLICE to 01 FILE	
Record Your Own	REC.
- EDIT on REC.; SRC picks line-in, USB, or TR1-8 - ARM starts recording once the input passes a threshold - Process, name, and SAVE before leaving the editor	
Build a Kit Sample	QUICK RENDER
- Sequence your one-shots in a phrase, one per step - Quick render the selection, then PROCESS → SLICE:AUTO - One instrument now plays the whole kit from C-1	
Random Slices	RNL
- RNL in the first FX column randomizes the note (the slice) - Keep its second digit 0 so the instrument doesn't change - SED at the phrase start repeats a take you like	

★ RECIPES	
Chop a Break	SLICE:AUTO
- Editor: PROCESS → SLICE:AUTO (or SLICE:16), then SAVE - Instrument: SLICE → 01 FILE; notes from C-1 play the slices - Rearrange notes, RET 03 on snares, CHA on ghost hits	
Loops in Tempo	REPITCH/BPM
- PLAY → REPITCH/BPM; set STEPS/BPM to the loop's length - Changing TPO keeps it in time (the pitch moves with it)	
Resample & Layer	EDIT ×2
- Song view: SHIFT + OPTION select phrases, double-tap EDIT - QUICK RENDER creates a new instrument (needs a free slot) - Slice, DEGRADE, or re-render it: layers without using tracks	
Pad From a One-Shot	FWDLOOP
- PLAY → FWDLOOP; set LOOP ST. inside the steady part - XFADE LOOP in the editor removes the loop click - ADSR on volume with a long REL; end notes with OFF	
Humanized One-Shots	LFO RANDOM
- MOD → LFO, OSC RANDOM, TRIG RETRIG - Low AMT on CUTOFF or volume: every hit sounds a bit different	
Old-School Warp	STA
- Short notes with a new STA each step replay from new spots - Play low notes for slowed, grainy textures	
Reverse Swell	PLAY REV
- PLAY → REV on a crash or vocal, timed to end on the downbeat - Reverse reverb: quick render it with REV, then REVERSE	
Timestretch Loop	LFO → LOOP ST.
- PLAY → FWDLOOP; MOD → LFO with DEST LOOP ST. - OSC RAMP UP, TRIG RETRIG so each note restarts the scan - FREQ is in steps (10 = one bar); AMT sets how far it scans	
Stutter Fills	RET · LEN
- RET 03 on a slice note repeats its start - LEN on the same step shortens each repeat for a tight glitch
